Easy to use with intuitive masks and processes

alseda has developed a new software which allows you to manage and operate all relevant processes and operations of a modern electronic point of sale application within banks and within your **SAP** system.

Flexibility

The new solution alseda ETS stands for **„Extended Teller System"** and offers you the possibility to stay flexible in your processes which can easily be displayed within this front-end point-of-sale solution. New processes and bank relevant products can be incorporated at any time in no time, without producing much effort.
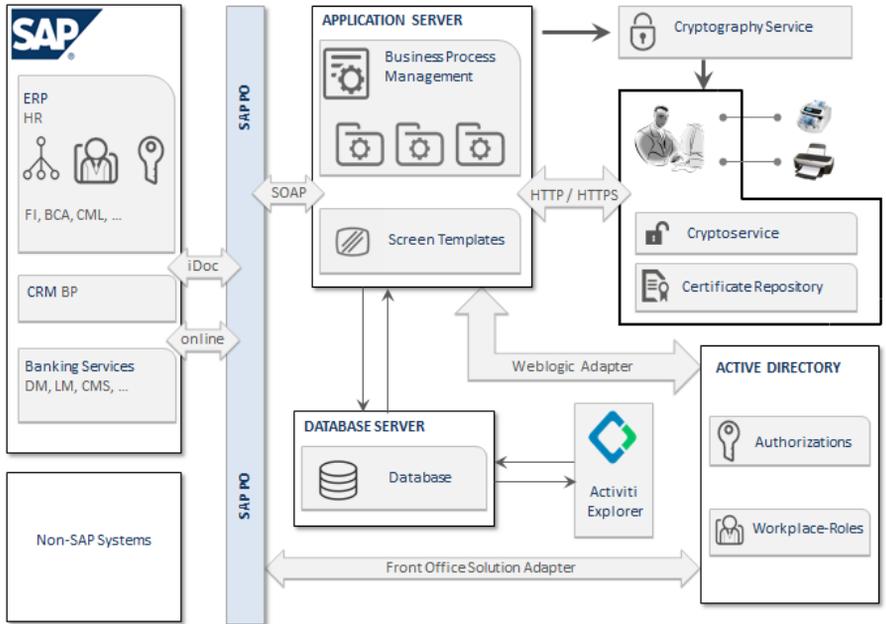

A newly created process configurator „**Activiti Explorer**" allows for quick changes to stay flexible within your **SAP** environment.

Intuitive

alseda ETS gives your employees the chance to work on a very intuitive basis without having to gain massive know how prior to working with the software.

All relevant processes, e.g. cash-related transactions, start- and end-of-day processes, cash management, currency exchange, etc. are accessable and can easily be changed or newly created hand in hand with a dynamic business environment. The result is less training effort and higher data quality.

Integrative

alseda ETS can easily be integrated into your system landscape, supporting **SAP**

and Non-SAP environments.

It will become a fully integrated part of your **SAP** system environment.

The software claims to ensure secure transactions and higher work efficiency in any given IT infrastructure. The independent character of alseda ETS therefore ensures less risk and cost for implementation.

Transparent

alseda ETS claims to be as transparent as possible, supported by the integrated authorization concept of your SAP, i.e. company-specific user authorizations defined in **SAP Human Resources** become synchronized with the workplace roles, defined in the Active Directory of alseda ETS via the standard middleware **SAP Process Orchestration** (SAP NetWeaver). This approach ensures strict user concepts and parallely allows to stay flexible in authorization role concepts, to offer the possiblility to adapt to changing organizational structures.

alseda ETS ensures that individual workplaces can be freely configured by defining separate workplace roles in the Active Directory.

Alseda ETS even offers the possibility to maintain your own sub-ledger, while for example using SAP Financials (FI) for your general ledger accounting.

Functionality

alseda ETS enables and supports all functionalities present in a point-of-sale environment of banks.

All cash-related transactions can be fully handled and displayed transparently for the involved staff.
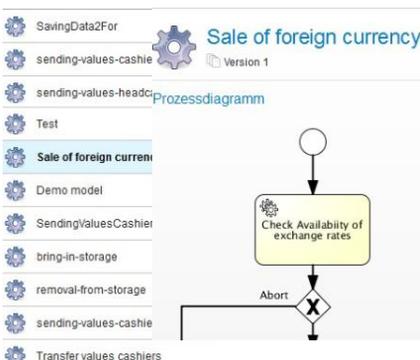

Reports and Analysis

Control your work better and make sure that totals, reserved and available amounts in different currencies, department working shifts and listings of all performed actions throughout the day for any employee, etc. can easily be reported and viewed.

Standard functionality includes several engagement and analysis reports for controlling purposes, ensuring an extra transparency throughout your company. Including customer specific reports is also possible.

Multi-lingual

Make sure your employees can all work with the same tool, without language barriers or additional training. alseda ETS supports several languages to ensure better working conditions on a multilingual basis for everybody.

The software simplifies communication and therefore creates a better understanding and seamless work processes.

Integration with SAP

Make sure your point-of-sale software is fully integrated with your **SAP** and **Banking Services** platform environment. alseda ETS allows for a seamless fit-in while staying flexible on both sides.

alseda is an official SAP Partner and expert, when it comes to banking and also other SAP-related applications.

Our expert history goes back long ways allowing you to sit back and let us take care of the rest.

Integration with Non-SAP

alseda ETS also handles your non-SAP environment and ensures seamless integration with all connected applications.

### Integration of peripheral devices

alseda ETS allows you to use any typical peripheral **input- and output devices**, e.g. automatic vaults, scanners (e.g. for barcodes or fingerprints), cash-recycling machines, printers, card readers or PIN and Pen pads, etc.

Example:

A customer enters your bank and wants to take out USD 1000 in cash from his account at the counter. Unfortunately he forgot his account number!

The cashier asks the customer for his personal ID and scans it with his scanner. Immediately the ID information is read by alseda ETS and automatically compared with **SAP Business Partner** master data.

The cashier can see the customer data, including the account number information on his screen within seconds after scanning the personal ID.

He clicks on the account number and alseda ETS automatically creates a new screen for him showing the customers relevant account information, gathered automatically by alseda ETS by calling **SAP Deposits Management**. After triggering the cash payment, alseda ETS immediately pops up an error, saying the current account balance and limit is exceeded and that USD 500 can maximally be taken out.

The customer decides to take out the maximum amount and the cashier can complete the cash payment.

The benefits for your company:

- **More efficiency through an easy integration into your Non-/SAP environment**

- **Improved work processes through automated functionalities**

- **More information and transparency through reports, controlling functionality and flexible authorization role concepts.**

- **Cost advantages through a standard solution, fully integratable**

- **Central support and further development through alseda GmbH**

- **Easy to use processes and masks**

- **Reduced training effort and increased work efficiency**

- **Reduced projectcosts and –risk and fast implementation**
